EDUCATION

California State University, Los Angeles

Los Angeles, CA

B.S. in Computer Science

Expected May 2028

- Relevant Coursework: Data Structures & Algorithms, Assembly Language, Discrete Mathematics, Linear Algebra

EXPERIENCE

Full-Stack Developer Intern

July 2026 – Present

KickPost

- Developed full-stack features on a **4-person** engineering team for KickPost's incentive platform, spanning real-time notifications, personalized newsfeeds, media uploads, in-product support, and deployment workflows.
- Cut notification lookup latency by **>99%** (1.5 s to **single-digit ms**) and eliminated 30-second polling through PostgreSQL indexing, authenticated SSE, and cross-instance updates.
- Built an in-product Help Drawer integrating contextual search and a document-grounded chatbot; benchmarked grounding and response accuracy with **200+** questions across **13** product documents.
- Eliminated per-viewer Newsfeed probes, avoiding up to **6** Algolia operations and **~5** PostgreSQL reads per viewer/event; kept nodes synchronized via PostgreSQL NOTIFY and SSE after Algolia publication.
- Migrated **40+** legacy AWS Lambda functions to GitHub Actions across dev, demo, and production.

PROJECTS

Esports Research Platform | *React, TypeScript, Effect, Cloudflare*

- Developed a full-stack platform for LoL and VALORANT research, combining live player-stat lines, team comparisons, historical performance, and saved evaluations with outcome tracking.
- Implemented **3** explainable scoring algorithms and versioned backtesting; Context v3's **200+** cohort recorded a **71.6%** historical hit rate across **81** non-push outcomes using frozen pre-match captures.
- Automated historical-data ingestion into Cloudflare D1/R2, separating raw source artifacts from queryable records and freezing pre-match evidence for reproducible model evaluation.

Distributed Log Aggregation System | *C++17, TypeScript, Python, SQLite*

- Built a **5-service** log platform with real-time search, anomaly detection, and a Next.js monitoring dashboard.
- Engineered a C++17 file-tail agent and thread-pooled, SQLite-backed queue for batched, persistent log delivery.
- Implemented SQLite FTS5 search and Isolation Forest anomaly detection with automated alerts; validated ingestion, queue persistence, APIs, and detection workflows through **200+** tests at **90%+** coverage.

College Discovery Platform | *Next.js, React, TypeScript, PostgreSQL, Clerk*

- Won Best Use of Solana at HackMesa 2.0 for building a college-discovery and friend-matching platform.
- Implemented matching across **778** school-tag associations with Neon Postgres and Clerk.

Riot Esports Tracker | *TypeScript, Effect, AWS*

June 2025 – Present

- Published a Chrome extension serving **10+** users with esports schedules, streams, and alerts from **4** sources.
- Built an Effect-based AWS pipeline for LoL/VALORANT with **2-hour** refreshes and private S3/CloudFront delivery; added **60-second** extension caching to preserve schedules during failed refreshes.

TECHNICAL SKILLS

Languages: TypeScript/JavaScript, Python, C++, Java, SQL, HTML/CSS

Frontend & UI: React, Next.js, MUI, Tailwind CSS, TanStack Query, Zustand

Backend & APIs: Node.js, Effect, Express.js, Hapi, FastAPI, Knex, REST APIs, Convex

Data & Cloud: PostgreSQL, SQLite, Algolia, AWS Lambda/S3, Cloudflare, Google Cloud, Supabase

Testing & Engineering: Vitest, Jest, Pytest, Unit/Integration Testing, CI/CD, Agile Methodologies

Tools & Platforms: Git, GitHub Actions, Docker, CMake, SFML, Clerk, Codex, Claude Code
