EDUCATION

California State University, Los Angeles

B.S. in Computer Science

Los Angeles, CA

Expected May 2028

- Relevant Coursework: Data Structures & Algorithms, Assembly Language, Discrete Mathematics, Linear Algebra

EXPERIENCE

Full-Stack Developer Intern

July 2026 – Present

KickPost

- Cut notification lookup latency by **>99%** (1.5 s to **single-digit ms**) with PostgreSQL JSONB and GIN indexes.
- Eliminated **100%** of routine polling by replacing 30-second notification checks with JWT-authenticated SSE.
- Migrated **40+** legacy Lambdas to GitHub Actions for consistent dev, demo, and production deployments.
- Eliminated per-viewer Newsfeed probes, avoiding up to **6** Algolia operations and **~5** PostgreSQL reads per viewer/event; delivered cross-instance updates via PostgreSQL NOTIFY and SSE after Algolia publication.
- Offloaded **100%** of new media bytes from the API by migrating **4** upload surfaces to presigned S3 uploads.
- Developed an in-product Help Center with route-specific guidance, search, favorites/recents, and state restoration; integrated accessible, responsive drawers with detail panels to preserve active workflows.

PROJECTS

Esports Research Platform | *React, TypeScript, Effect, Cloudflare*

- Developed a full-stack platform for LoL and VALORANT research, combining live player-stat lines, team comparisons, historical performance, and saved evaluations with outcome tracking.
- Implemented **3** explainable scoring algorithms and versioned backtesting; Context v3's **80+** cohort recorded a **71.6%** historical hit rate across **81** non-push outcomes using frozen pre-match captures.
- Automated historical-data ingestion into Cloudflare D1/R2, separating raw source artifacts from queryable records and freezing pre-match evidence for reproducible model evaluation.

Distributed Log Aggregation System | *C++17, TypeScript, Python, SQLite*

- Built a **5-service** log platform with real-time search, anomaly detection, and a Next.js monitoring dashboard.
- Engineered a C++17 file-tail agent and thread-pooled, SQLite-backed queue for batched, persistent log delivery.
- Implemented SQLite FTS5 search and Isolation Forest anomaly detection with automated alerts; validated ingestion, queue persistence, APIs, and detection workflows through **200+** tests at **90%+** coverage.

College Discovery Platform | *Next.js, React, TypeScript, PostgreSQL, Clerk* HackMesa 2.0 – Best Use of Solana

- Built a college and friend-matching app connecting students with **250+** schools and peers with shared interests.
- Implemented deterministic matching across **778** school-tag associations in Neon Postgres, preserving quiz results, saved schools, and selected-school state across authenticated sessions.
- Deployed on Vercel with Clerk authentication, demo access, and hide/block/report controls for student safety.

Riot Esports Tracker | *TypeScript, Effect, AWS*

June 2025 – Present

- Published a Chrome extension serving **10+** users with esports schedules, streams, and alerts from **4** sources.
- Built an Effect-based AWS pipeline for LoL/VALORANT with **2-hour** refreshes and private S3/CloudFront delivery; added **60-second** extension caching to preserve schedules during failed refreshes.

TECHNICAL SKILLS

Languages: TypeScript/JavaScript, Python, C++, Java, SQL, HTML/CSS

Frameworks & Libraries: React, Next.js, Effect, Express.js, FastAPI, Tailwind CSS, scikit-learn, SFML

Data & Cloud: PostgreSQL, SQLite, Algolia, AWS Lambda/S3, Cloudflare, Google Cloud, Supabase, Convex

Tools & Runtime: Node.js, Git, GitHub Actions, Docker, CMake, Clerk, Mapbox
